CLEAVAGE OCCURS AT A DEFINED SITE, PPCE/THET, WITHIN THE HCF REPEAT. PTM: GLYCOSYLATED; CONTAINS O-LINKED N-ACETYLGLUCOSAMINE RESIDUES. SIMILARITY: CONTAINS 5 KELCH REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ASSOCIATE.
TISSUE SPECIFICITY: HIGHLY EXPRESSED IN FETAL TISSUES AND THE ADULT KIDNEY. PRESENT IN ALL TISSUES TESTED.
DOMAIN: THE HCF REPEAT IS A HIGHLY SPECIFIC PROTEOLYTIC CLEAVISIONAL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PROTEIN OCT-1, TO FORM A MULTIPROTEIN-DNA COMPLEX RESPONSIBLE FO ACTIVATING TRANSCRIPTION OF THE HSV IMMEDIATE EARLY GENES.
SUBUNIT: COMPOSED PREDOMINANTLY OF SIX POLYPEPTIDES RANGING FROM 110 TO 150 kDa AND A MINOR 300 kDa POLYPEPTIDE. THE MAJORITY OF AND C-TERMINAL CLEAVAGE PRODUCTS REMAIN TIGHTLY, ALBEIT NONCOVALENTLY, ASSOCIATED.
SUBCELLULAR LOCATION: 1SOFORMS; A LONG FORM (SHOWN HERE) AND ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND ASHORT FORM; MAY BE PRODUCED BY ALTERNATIVE SPLICING. IN THE SHORTER FORM THE N- AND THE C-TERMINAL FRAGMENTS FAIL TO
